

CardioViz Heart Disease Analysis Project Report

Objective

Analyze heart disease data with SQL and Tableau to identify demographic, lifestyle, and health factors associated with cardiovascular risk.

Dataset

The project uses 4500 raw records and 18 fields covering BMI, smoking, stroke, diabetes, activity, general health, age, race, and related conditions.

Workflow

Collect data, validate quality, store in SQL, create analysis views, prepare Tableau-ready exports, build ten visualizations, and assemble a responsive dashboard.

Key Visuals

Gender, age, diabetes, stroke, smoking, alcohol, race, general health, physical activity, BMI, and combined risk cohort views.

Website

The Flask website is branded as CardioViz and includes project overview, role-based dashboards, SQL console, data story, Tableau-style analytics, and dataset download.

Deliverable	Location
Raw dataset	Dataset/heart.csv
Clean dataset	Data_Cleaning/cleaned_heart.csv
SQL queries	SQL/analysis_queries.sql
Tableau workbook	Tableau/Heart_Disease_Dashboard.twbx
Presentation	Report/Presentation.pptx
